The fuel fuel resources are limited along with the need to reduce emission which is major impetus to the development of alternative fuel. Biodiesel has been developed as an alternative fuel for CI engine but it shows slightly lower performance and reduction in SOx, CO, HC, CO2 emissions as compared with diesel. But due to higher oxygen content in biodiesel the formation of NOx was observed higher. Nanofuels have shown better improvement in combustion, performance and emission characteristics of the CI engine. The blending of biodiesel increases the thermal efficiency near to that of diesel and also a significantly large reduction in NOx is observed. Nano fuels were prepared by adding the cerium oxide nanoparticles to the cottonseed based diesel. Fuel was manufactured from cottonseed oil using the transesterification process. Nano fuels were prepared with high-speed ultrasonication and agitation process to increase stability.

Prof. Dhruj S. Patil completed his bachelor's degree in Mechanical Engineering & master degree in Theoretical Engineering. He has 6 years of working experience in the field of Mechanical Engineering research and has published most of his research papers in International Journals like ASME, ADVTEB Etc.
